(adalimumab)

Paediatric Patient Reminder Card

This card contains selected important safety information that you need to know before and during your child's treatment with Yuflyma.

- Keep this card with you at all times and for up to 4 months after your child's last injection of Yuflyma.
- Present this card to any doctor or healthcare professional that your child sees.
- You can record any tuberculosis tests or treatment your child may have had, inside of this card.

If you have any questions, speak to your healthcare professional about your child's treatment.

Not all possible side effects are listed on the inside of this Card. Please read the Yuflyma package leaflet or speak with your HCP for more information about side effects.

Introduction

Yuflyma is a medicine that is intended to treat certain diseases that affect the immune system. While Yuflyma can be effective in treating these diseases, some people can have one or more side effects. It is important to talk to your child's HCP about the possible benefits and possible side effects of taking Yuflyma. These can be different for each person.

- The purpose of this card is to tell you about some of the possible side effects of Yuflyma.
- Some of the serious side effects that could occur include infections, cancer, and nervous system problems.
- This is not a full list of the possible side effects of Yuflyma.
- Certain vaccines may cause infections and should not be given while receiving Yuflyma. Please check with your doctor before your child receives any vaccines.

Before Yuflyma Treatment

Tell your child's HCP about any health problems your child has and any medicines your child takes. This will help the doctor decide if Yuflyma is right for your child. Tell your child's HCP if your child:

- Has an infection or symptoms of an infection. (such as fever, wounds, feeling tired, dental problems.)
- Has tuberculosis or has been in close contact with someone with tuberculosis.
- Has or has had cancer.
- Has any numbness or tingling or has a problem that affects the nervous system.

Your child's HCP should check your child for signs and symptoms of tuberculosis before starting Yuflyma. Your child may need to be treated for tuberculosis before he or she starts Yuflyma.

Vaccination

Your child's doctor may suggest certain vaccinations for your child before they start Yuflyma. Live vaccines should not be administered to your child while taking Yuflyma. If your child receives Yuflyma while pregnant, it is important that you inform the baby's doctor before the baby receives any vaccine. The baby should not receive a "live vaccine", such as BCG (used to prevent tuberculosis) within 5 months following the mother's last Yuflyma injection during pregnancy.

During Yuflyma Treatment

To make sure that Yuflyma is working properly and safely for your child, you should check in with your child's HCP regularly to discuss how your child is doing. Tell your child's HCP right away about any changes in your child's condition.

Keep your child's HCP informed about how Yuflyma is working for your child.

- **It is important to call your child's HCP right away about any unusual symptoms your child may have.** This will help make sure your child gets the right care. It will also lower the chance of a side effect becoming worse. Many side effects including infections can be managed if you tell your child's HCP right away.

- If your child gets a side effect, your child's HCP will decide if your child should continue or stop Yuflyma treatment. It is important to talk with your child's HCP to find out what is right for your child.
- Since side effects can happen after your child's last dose of Yuflyma, tell your child's HCP about any problems that your child may have up to 4 months after your child's last injection of Yuflyma.

Tell your child's HCP about:

- Any new medical conditions that your child has.
- New medicines your child is taking.
- Any surgery or operation that is planned for your child.

Some people taking Yuflyma may get serious side effects, including:

Infections: Yuflyma helps people with certain inflammatory diseases. It does this by blocking a part of the immune system. However, this part of the immune system also helps fight infection. This means Yuflyma can make your child more likely to get infections or make any infection that your child may have worse. This includes infections such as colds or more serious infections like tuberculosis.

Cancer: If your child takes Yuflyma, the risk of getting lymphoma (a cancer that affects the lymph system), leukaemia (a cancer that affects the blood and bone marrow) or other cancers may increase. Cases of non-melanoma skin cancer have been observed in patients taking Yuflyma.

Nervous system problems: Some people have developed new or worsening nervous system problems with adalimumab. This includes multiple sclerosis.

Please read the Yuflyma package leaflet for more information. These are not all of the possible side effects that may occur during treatment with Yuflyma.

Call your child's HCP or get medical care right away if your child has any of the following symptoms of these possible serious side effects:

Infections: fever, chills, unusual sweating, feeling unwell or more tired than normal, feeling or being sick (such as nausea or vomiting), diarrhoea, stomach pain, loss of appetite or weight loss, cough or coughing up blood or mucus, shortness of breath, problems urinating, skin sores, wounds, muscle aches, dental problems.

Cancer: night sweats; swelling of the lymph nodes (swollen glands) in the neck, armpits, groin or other areas; weight loss; new skin lesions or change in skin lesions (such as moles or freckles) your child already has; severe itchiness that cannot be explained.

Nervous system problems: numbness or tingling, vision changes, muscles weakness, unexpected dizziness.

Tell your child's HCP about any unusual symptoms that your child has during treatment with Yuflyma. This includes any possible side-effects not listed in this leaflet.
